PROFILE

조동빈 DONGBIN CHO

Birth 1993.01.05

Email ken.dbc.career@gmail.com

Education

2020.03.01 ~ 2022.02.25	Computer Science Department, Hanyang University **[MS]** **한양대학교 컴퓨터소프트웨어학과**
2012.03.01 ~ 2018.08.31	Industrial Engineering Department, Kangwon University **[BS]** **강원대학교 산업공학과**

Work Experience

2022.06.20 ~ Present

[Undfined] Dev.Team
[언디파인드] 개발팀
Chatbot & Reco. System Developer
챗봇 & 추천 알고리즘 개발자

2019.12.26 ~ 2020.02.29

[Kakao] Reco.Team
[카카오] 추천팀
Reco. System Developer
추천 알고리즘 개발자

2018.11.05 ~ 2019.04.22

[HanbitSoft] AI.Part
[한빛소프트] 인공지능파트
Text/Audio Chatbot Developer
텍스트/음성 챗봇 개발자

Publications

2022 BIB Journal
(Briefings in Bioinformatics)

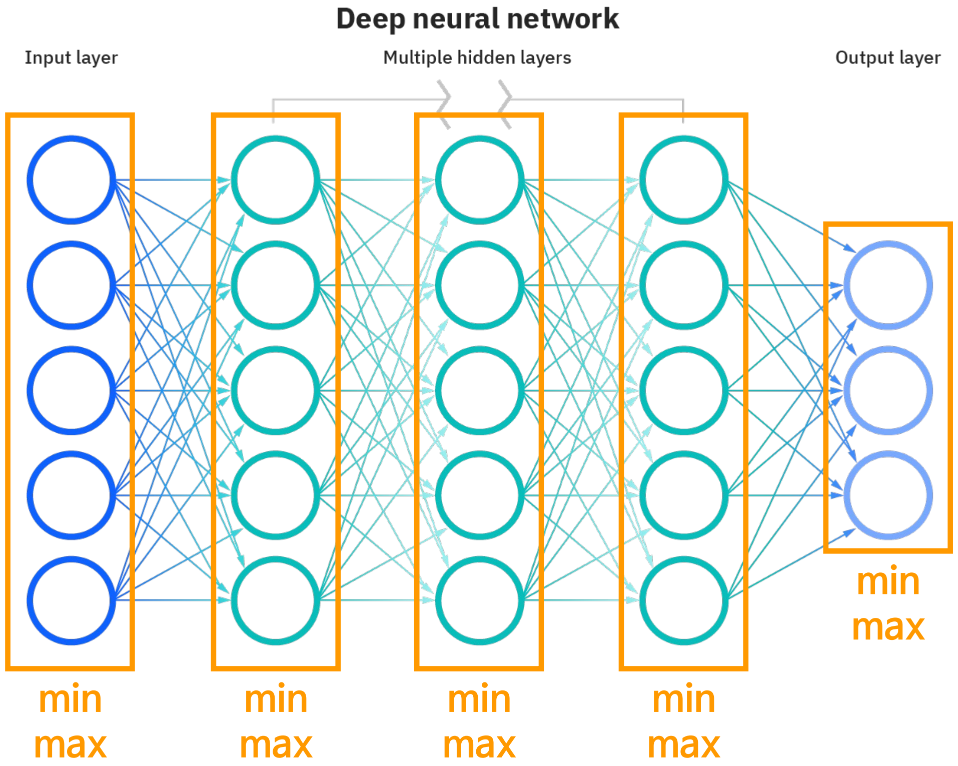
DNN Model Quantization

Definition	What is	General DNN models use Float32 type variables
		Quantized models use low-bit INT types at inference
	What for	• Model storage • In memory load • Matrix multiplication with Float32 type cause bottleneck/unusability in low performance H/W

[1] DNN Model Quantization

Problem	Problem	Quantized models' **performance (e.g., accuracy) drops catastrophically when using sub-8bit INT type**
	Why legacy tech. suffers	**Too generalized Quantization parameters** • Quantization parameters require: Per layer avg-ed min/max range of intermediate outputs across datasets
		Averaged min/max values include outliers



[1] DNN Model Quantization

Solution

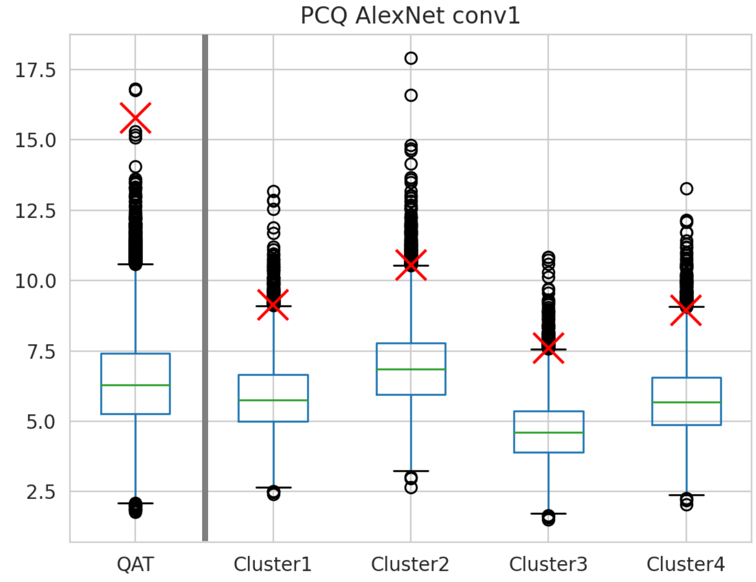
Granular Exponential Moving Average (Granular EMA)

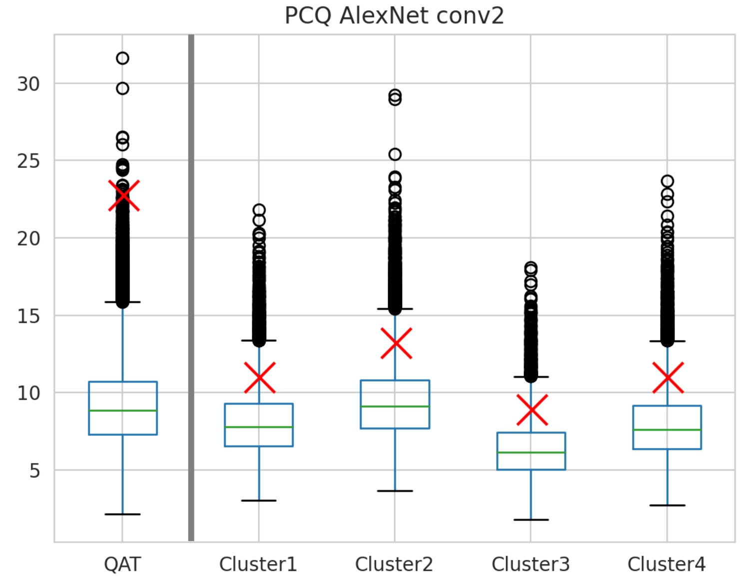
Train Quantization Parameters while **excluding outliers**

Neural Network Aware Clustering (NNAC)

Train Quantization Parameters separately **across clusters of input images**

- Some data might need **shorter min/max range**
- Shorter range means **less information loss**





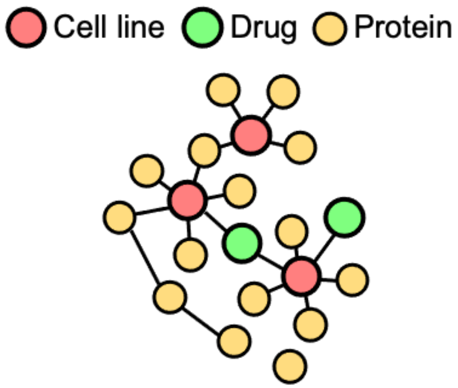
Figures' Description

- Shows that our method
  - how efficiently exclude outliers
  - how to work with clusters
- QAT : Baseline (Google)
- Cluster* : Ours
- X : Trained maximum value
- Box-plots : Actual max values per image

Network Embedding Generation

* **Published in 2022 BIB** (Briefings in Bioinformatics) **Journal**

Project description	[Human Cell lines – Cancer Drugs] Response Prediction
	Network (graph) dataset consist of • **Cell line** nodes • **Drug** nodes • Protein nodes (connected to Cell lines)
	My Task: **Train embedding vectors of Cell lines and Drugs**
Problem	Extremely unbalanced dataset • About **20,000 Protein nodes** • About 900 Cell line nodes • About 300 Drug nodes
	Fails to reflect the relationships between Cell lines & Drugs
	As a result, we got poor response prediction performance



[2] Network Embedding Generation

Solution	
	Make training process to **focus on relationships between Cell lines & Drugs**
	Response-aware Negative Sampling (RA-NS) • **Cell line & Drug** nodes use **resistant Drug & Cell line** nodes as their negative samples

* Tested Models: **Node2Vec**, Graph Convolutional Network, Graph Transformer Network

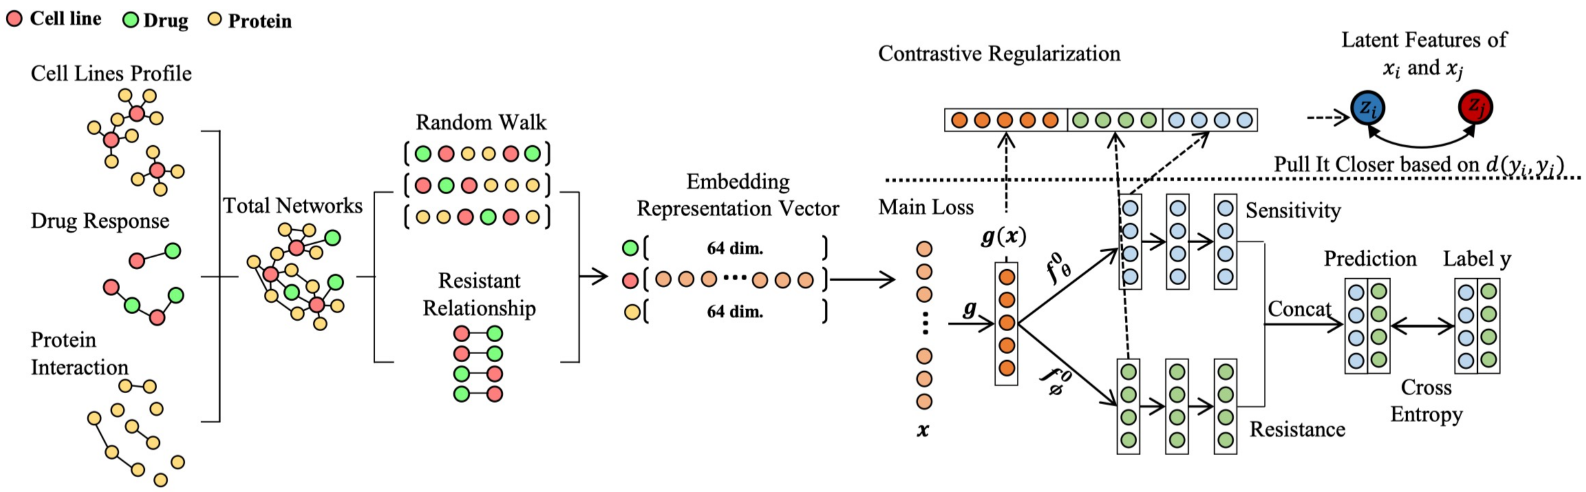


Fig. 1. The framework of RAMP. RAMP consists of two main stages. First, representation vectors are extracted from heterogeneous networks with RA-NS. Second, the multitask architecture of a Bayesian neural network is trained by representation vectors with contrastive regularization.

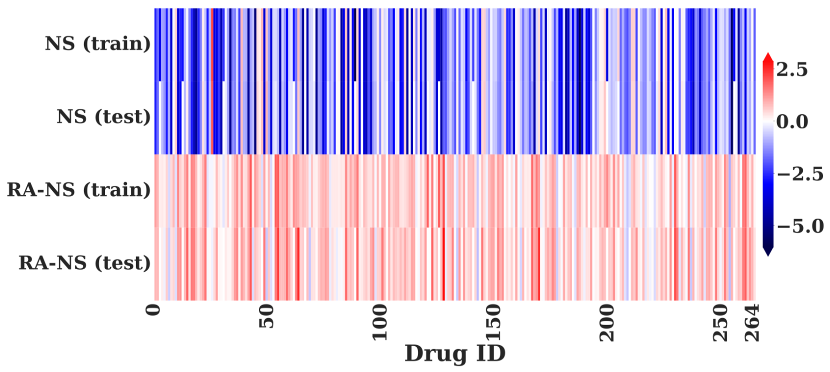

Fig. 2. Embedding similarities among drug and cellines. We subtract the similarity of a drug and its resistant cell lines from the similarity of the drug and its responsive cell lines. The results are normalized and plotted in a heatmap format. The higher (or redder) the value is, the better the embedding reflects the network structure.

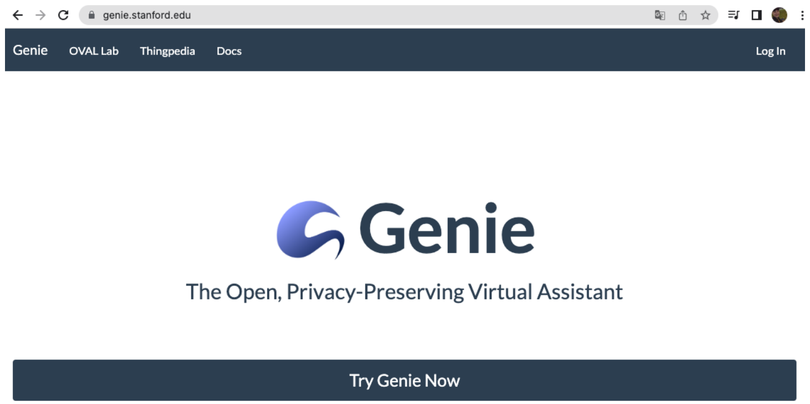
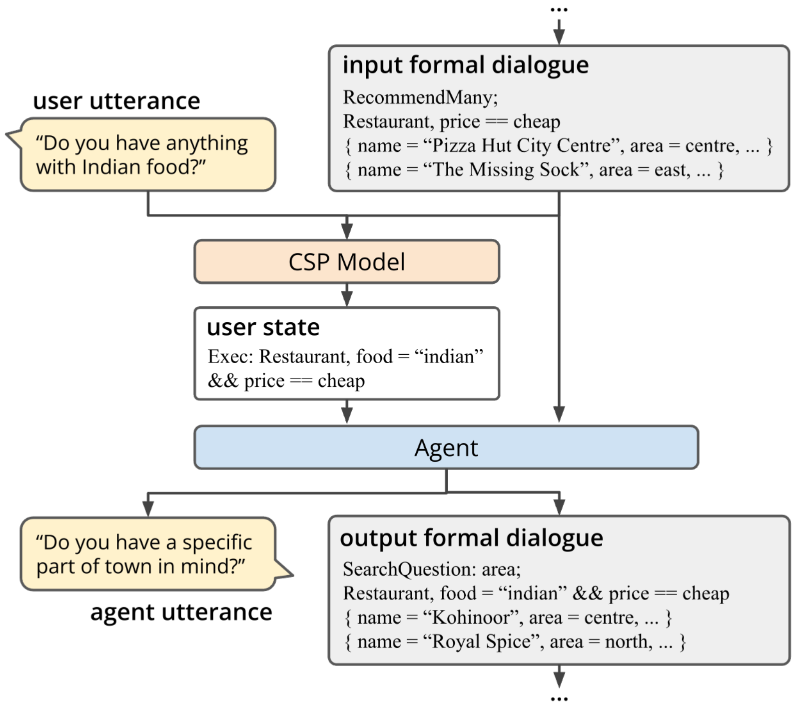
Artificial Intelligence Assistant

- AI Assistant App, **Almond**
  - Currently, the service name has been modified to Genie
  - Developed by Stanford OVAL Lab

- **Training Korean Seq2SQL Model**
  - Dataset preparation
    - Web Crawling
    - Construct templates of sentences (example of sentences)
    - Augment sentences based on templates
  - Train & serve model





DNN Model Quantization

* **Published in 2022 ICEIC** (International Conference on Electronics, Information, and Communication)

Problem	**Quantization Aware Training** (Google) • Fake-quantize all of the weight matrices with a single low-bit type • **Too much quantization errors** occur and the trained model gets ruined
	QuantNoise (Facebook) • Fake-quantize probabilistically selected subsets of matrices (a subset per matrix) • Trained models **under-prepared** for Quantization
Solution	**Fake Single Precision Training (FST)** • Probabilistically select subsets of weight matrices as QuantNoise • Fake-quantize **selected subsets** with **low-bit type** • Fake-quantize **the rests** with **higher bit type** than the selected

(EN) Text/Audio Chatbot

Speech Recognition → Sentence Classification → Sentence Generation → Speech Synthesis

Sentence Classification

Problems

- High classification error

Solutions

- Dataset relabeling
- Applied proper metric to evaluate unbalanced classes
- Made model to be more robust at typo from Speech Recognition (FastText)

Sentence Generation

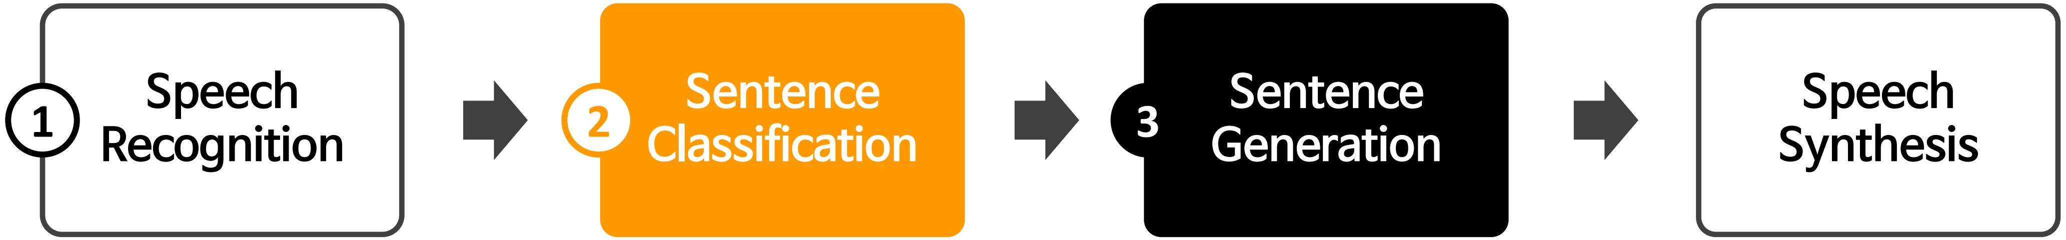
Problems

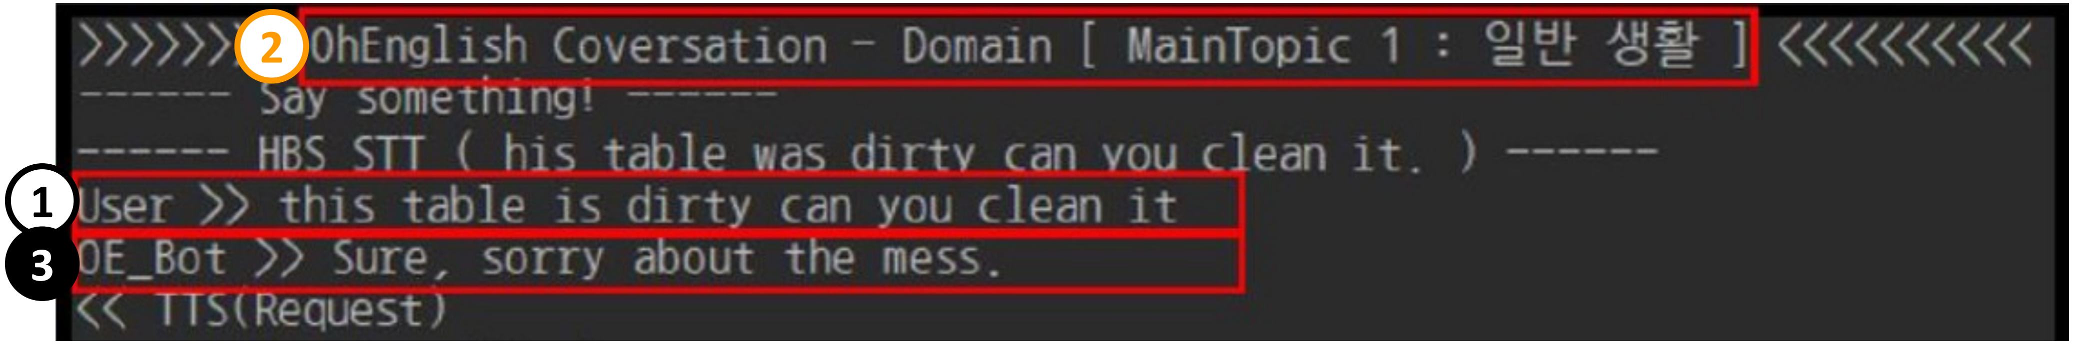
- Poor performance of long-sentences generation

Solutions

- Applied attention mechanism to Seq2Seq model

(EN) Text/Audio Chatbot





(KR) Multi-speaker Speech Synthesis Model
